

Don't train people only to use AI. Train them to improve processes with AI.

Process teams are charged with understanding how work gets done, where it breaks down, and what should change. When they use AI well, they can produce better models, clearer decisions, stronger recommendations, and better business results.

WHERE PROCESS TURNS AI ACTIVITY INTO BUSINESS VALUE

When teams apply AI with process understanding and a clear focus on outcomes, the business sees measurable improvement.

FEWER DELAYS

When process teams use AI during discovery and analysis, issues surface sooner and decisions move forward faster.

Example:

Problems surface before momentum drains out of the initiative.

LESS REWORK

AI can help process teams clarify handoffs, gaps, requirements, and risks before small misses become expensive rework.

Example:

Teams catch the miss before it becomes another round of budget, meetings, and frustration.

BETTER DECISIONS

AI can help process teams turn analysis into clearer options, risks, tradeoffs, and decision points.

Example:

Leaders can see the business impact before time, budget, and people are committed.

CLEARER ACTION

AI can help process teams turn findings into a stronger recommendation, clearer rationale, and next step leaders can approve.

Example:

The meeting ends with a decision, not another "circle back."

THE EXECUTIVE QUESTION

Are we training people to use AI – or to improve work with AI?

Start with the gap that matters most.

BPMInstitute.org helps teams find the process gaps that can keep AI adoption from producing real business value.
